GP Polishing pads are manufactured by Lake Country to our specifications with their patented CCS, Collapsed Cell Structure, technology taking polishing pads to a new frontier.

CCS Technology embeds small pockets of collapsed cells into the face of the polishing pad, creating reservoirs for the polish on the pad surface. These pockets offer distinct advantages over standard polishing pads by keeping polish fresh on the pad face longer and giving the user greater polisher control by relieving surface tension on the pad surface. The pads come in a convenient mushroom shape allowing the user to smoothly move over seams and paint curves.
